Project Report

Someone who is working with our domain which is a league of legends tournament database would absolutely be able to work with our database and be able to find whatever they needed. An example of someone needing our database would be a reporter who is writing about the different tournaments and teams involved in the 2016 season. This person could easily find any team they needed. All the players in that team, the games they played, the matches they won, and all the different tournaments they participated in and how well they did. We have an amazing amount of data and any researcher could find a lot to write about and find our database extremely useful. Another useful aspect of our web based program is the extra functionality that we have added to our page, this extra functionality being the front end being a lot crisper and we implement background pictures and make the whole layout much "cuter" and appealing to whoever is using it. We are also implementing a search bar that can find players, teams, or whatever else they are trying to find. This search bar will be extremely useful and it won't require users to make their own queries. As of right now the search is done expect for filtering. We have also implemented pages in our web app. Right now we have a champions page that shows the champs,their roles, and which players have used which champion with a count in descending order. A player page that shows region, role, name, country, team, and used champions. A team page that shows its players, their roles, tournaments won and amount won from that tournament, as well as a total amount won. All in all this database is something

that we are all very proud of because we put a lot of time into it to obtain all the data and create

a solid database with amazing feel and functionality.
